**FIELD OF THE INVENTION**

10 The present invention describes novel nitrosated and/or nitrosylated  
 $\alpha$ -adrenergic receptor antagonists, and novel compositions comprising at least one  
nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonist, and, optionally, at  
least one compound that donates, transfers or releases nitric oxide, elevates  
endogenous levels of endothelium-derived relaxing factor, stimulates endogenous  
15 synthesis of nitric oxide or is a substrate for nitric oxide synthase, and/or at least one  
vasoactive agent. The present invention also provides novel compositions  
comprising at least one  $\alpha$ -adrenergic receptor antagonist, and at least one compound  
that donates, transfers or releases nitric oxide, elevates endogenous levels of  
endothelium-derived relaxing factor, stimulates endogenous synthesis of nitric oxide  
20 or is a substrate for nitric oxide synthase, and/or at least one vasoactive agent. The  
present invention also provides methods for treating or preventing sexual  
dysfunctions in males and females, for enhancing sexual responses in males and  
females, and for treating or preventing benign prostatic hyperplasia, hypertension,  
congestive heart failure, variant (Prinzmetal) angina, glaucoma, neurodegenerative  
25 disorders, vasospastic diseases, cognitive disorders, urge incontinence, and  
overactive bladder, and methods for reversing the state of anesthesia.

**BACKGROUND OF THE INVENTION**

Adequate sexual function is a complex interaction of hormonal events and  
psychosocial relationships. There are four stages to sexual response as described in  
30 the *International Journal of Gynecology & Obstetrics*, 51(3):265-277 (1995). The first  
stage of sexual response is desire. The second stage of sexual response is arousal.  
Both physical and emotional stimulation may lead to breast and genital vasodilation  
and clitoral engorgement (vasocongestion). In the female, dilation and engorgement

of the blood vessels in the labia and tissue surrounding the vagina produce the "orgasmic platform," an area at the distal third of the vagina where blood becomes sequestered. Localized perivaginal swelling and vaginal lubrication make up the changes in this stage of sexual response. Subsequently, ballooning of the proximal portion of the vagina and elevation of the uterus occurs. In the male, vasodilation of the cavernosal arteries and closure of the venous channels that drain the penis produce an erection. The third stage of sexual response is orgasm, while the fourth stage is resolution. Interruption or absence of any of the stages of the sexual response cycle can result in sexual dysfunction. One study found that 35% of males and 42% of females reported some form of sexual dysfunction. Read et al, *J. Public Health Med.*, 19(4):387-391 (1997).

While there are obvious differences in the sexual response between males and females, one common aspect of the sexual response is the erectile response. The erectile response in both males and females is the result of engorgement of the erectile tissues of the genitalia with blood which is caused by the relaxation of smooth muscles in the arteries serving the genitalia.

In both pre-menopausal and menopausal females, sexual dysfunction can include, for example, sexual pain disorders, sexual desire disorders, sexual arousal dysfunction, orgasmic dysfunction, dyspareunia, and vaginismus. Sexual dysfunction can be caused, for example, by pregnancy, menopause, cancer, pelvic surgery, chronic medical illness or medications.

In males, some pharmacological methods of treating sexual dysfunctions are available, however, such methods have not proven to be highly satisfactory or without potentially severe side-effects. Papaverine now widely used to treat impotence, is generally effective in cases where the dysfunction is psychogenic or neurogenic and where severe atherosclerosis is not involved. Injection of papaverine, a smooth muscle relaxant, or phenoxybenzamine, a non-specific antagonist and hypotensive, into corpus cavernosum has been found to cause an erection sufficient for vaginal penetration, however, these treatments are not without the serious and often painful side effect of priapism. Also, in cases where severe atherosclerosis is not a cause of the dysfunction, intracavernosal injection of phentolamine, an  $\alpha$ -adrenergic antagonist, is used. As an alternative or, in some cases, as an adjunct to  $\alpha$ -adrenergic blockade, prostaglandin E<sub>1</sub> (PGE<sub>1</sub>) has been

administered via intracavernosal injection. A major side effect frequently associated with intracorporally delivered PGE<sub>1</sub> is penile pain and burning.

The use of  $\alpha$ -adrenergic receptor antagonists for the treatment and prevention of benign prostatic hyperplasia, hypertension, congestive heart failure, variant (Printzmetal) angina, glaucoma, neurodegenerative disorders, vasospastic diseases, cognitive disorders, urge incontinence, and overactive bladder, and for reversing the state of anesthesia has been described. For example, U.S. Patent Nos. 5,403,847, and 5,578,611, and WO 99/25345 describe treating benign prostatic hyperplasia with specific compounds; Stanaszek et al., *Drugs*, 25(4): 339-384 (1983) reviews the use of  $\alpha$ -adrenergic receptor antagonists to treat hypertension and congestive heart failure; Goodman and Gilman, *The Pharmacological Basis of Therapeutics* (9th Ed.), McGraw-Hill, Inc. (1995), describe the use of  $\alpha$ -adrenergic receptor antagonists to treat variant (Printzmetal) angina and vasospastic diseases, such as Raynaud's disease; U.S. Patent No. 4,590,202 and WO 99/07353 describe the use of adrenergic receptor antagonists in glaucoma therapy; U.S. Patent No. 5,498,623 describes the treatment of cognitive disorders such as endogenous depression, age dependent memory impairment, and Alzheimer's disease; U.S. Patent No. 5,281,607 describes the treatment of numerous neurodegenerative diseases, such as infantile spinal muscular atrophy, juvenile spinal muscular atrophy, hypokinetic movement disorder, Down's Syndrome in middle age, and senile dementia of Lewy body type; Sereis et al., *Neurourol. Urodyn.*, 31-36 (1998) describes the treatment of urge incontinence in women; Wein, *Urology*, 43-47, (1998) describes the treatment of overactive bladder; and U.S. Patent No. 5,635,204 discloses reversing the state of anesthesia.

There is a need in the art for new and improved treatments of sexual dysfunctions, and other diseases. The present invention is directed to these, as well as other, important ends.

### SUMMARY OF THE INVENTION

Nitric oxide (NO) has been shown to mediate a number of actions, including the bactericidal and tumoricidal actions of macrophages and blood vessel relaxation of endothelial cells. NO and NO donors have also been implicated as mediators of nonvascular smooth muscle relaxation. As described herein, this effect includes the dilation of the corpus cavernous smooth muscle, an event involved in the sexual

response process in both males and females. The effects of modified  $\alpha$ -adrenergic receptor antagonists which are directly or indirectly linked with a nitric oxide adduct, and which are optionally used in conjunction with NO donors, have not been previously investigated.

5 In arriving at the present invention it was recognized that the risk of toxicities and adverse effects that are associated with high doses of  $\alpha$ -adrenergic receptor antagonists can be avoided by the use of nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists or by the use of at least one  $\alpha$ -adrenergic receptor antagonist in combination with at least one nitric oxide donor. Such toxicities and  
10 adverse effects include postural hypotension, reflex tachycardia and other arrhythmias, syncope and, with respect to the ergot alkaloids, nausea and vomiting and, upon prolonged or excessive administration, vascular insufficiency and gangrene of the extremities. The smooth muscle relaxant properties of the  $\alpha$ -adrenergic receptor antagonists and of compounds that donate, release or transfer  
15 nitrogen monoxide or elevate levels of endogenous nitric oxide or endothelium-derived relaxing factor (EDRF) or are substrates for nitric oxide synthase work together to permit the same efficacy with lower doses of the  $\alpha$ -adrenergic receptor antagonists or work synergistically to produce an effect that is greater than the additive effects of the  $\alpha$ -adrenergic receptor antagonist and the compound that  
20 donates, releases or transfers nitrogen monoxide or elevate levels of endogenous nitric oxide or EDRF or is a substrate for nitric oxide synthase.

One aspect of the present invention provides novel nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists. The  $\alpha$ -adrenergic receptor antagonists can be nitrosated and/or nitrosylated through one or more sites such as  
25 oxygen (hydroxyl condensation), sulfur (sulfhydryl condensation), carbon and/or nitrogen. The present invention also provides compositions comprising a therapeutically effective amount of such compounds in a pharmaceutically acceptable carrier.

Another aspect of the present invention provides compositions comprising a  
30 therapeutically effective amount of at least one  $\alpha$ -adrenergic receptor antagonist, that is optionally substituted with at least one NO and/or NO<sub>2</sub> group (i.e., nitrosylated and/or nitrosated), and at least one compound that donates, transfers or releases nitrogen monoxide as a charged species, i.e., nitrosonium (NO<sup>+</sup>) or

nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The present invention also provides for such compositions in a pharmaceutically acceptable carrier.

5 Yet another aspect of the present invention provides compositions comprising a therapeutically effective amount of at least one  $\alpha$ -adrenergic receptor antagonist, that is optionally substituted with at least one NO and/or NO<sub>2</sub> group (i.e., nitrosylated and/or nitrosated), at least one vasoactive drug, and, optionally, at least one compound that donates, transfers or releases nitrogen monoxide as a charged  
10 species, i.e., nitrosonium (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The invention also provides for such compositions in a pharmaceutically acceptable carrier.

Yet another aspect of the present invention provides methods for treating  
15 and/or preventing sexual dysfunctions and/or enhancing sexual responses in patients, including males and females, by administering to a patient in need thereof a therapeutically effective amount of at least one nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonist and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium  
20 (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The methods can further comprise administering a therapeutically effective amount of at least one vasoactive agent. Alternatively, the methods for treating and/or preventing sexual dysfunctions and/or enhancing  
25 sexual responses in patients, including males and females, can comprise administering a therapeutically effective amount of at least one nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonist, at least one vasoactive agent, and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species,  
30 nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists, nitric oxide donors, and/or vasoactive agents can be administered separately or as components of the same

composition in one or more pharmaceutically acceptable carriers.

The present invention also provides methods for treating and/or preventing sexual dysfunctions and/or enhancing sexual responses in patients, including males and females, by administering to a patient in need thereof a therapeutically effective amount of at least one  $\alpha$ -adrenergic receptor antagonist and at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium ( $\text{NO}^+$ ) or nitroxyl ( $\text{NO}^-$ ), or as the neutral species, nitric oxide ( $\text{NO}\bullet$ ), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The methods can further comprise administering a therapeutically effective amount of at least one vasoactive agent. Alternatively, the methods for treating and/or preventing sexual dysfunctions and/or enhancing sexual responses in patients, including males and females, can comprise administering a therapeutically effective amount of at least one  $\alpha$ -adrenergic receptor antagonist, at least one vasoactive agent, and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium ( $\text{NO}^+$ ) or nitroxyl ( $\text{NO}^-$ ), or as the neutral species, nitric oxide ( $\text{NO}\bullet$ ), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The  $\alpha$ -adrenergic receptor antagonists, the nitric oxide donors, and the vasoactive agents can be administered separately or as components of the same composition in one or more pharmaceutically acceptable carriers.

The present invention also provides methods using the compounds and compositions described herein to prevent or treat benign prostatic hyperplasia, hypertension, congestive heart failure, variant (Prinzmetal) angina, glaucoma, neurodegenerative disorders, vasospastic diseases, cognitive disorders, urge incontinence, or overactive bladder, or to reverse the state of anesthesia by administering to a patient in need thereof a therapeutically effective amount of at least one of the compounds and/or compositions described herein. In these methods, the  $\alpha$ -adrenergic receptor antagonists that are optionally nitrosated and/or nitrosylated, nitric oxide donors and vasoactive agents can be administered separately or as components of the same composition in one or more pharmaceutically acceptable carriers.

These and other aspects of the present invention are described in detail

herein.

The term "sexual dysfunction" generally includes any sexual dysfunction in a patient, including an animal, preferably a mammal, more preferably a human. The  
10 patient can be male or female. Sexual dysfunctions can include, for example, sexual desire disorders, sexual arousal disorders, orgasmic disorders and sexual pain disorders. Female sexual dysfunction refers to any female sexual dysfunction including, for example, sexual desire disorders, sexual arousal dysfunctions, orgasmic dysfunctions, sexual pain disorders, dyspareunia, and vaginismus. The  
15 female can be pre-menopausal or menopausal. Male sexual dysfunction refers to any male sexual dysfunctions including, for example, male erectile dysfunction and impotence.

The present invention is directed to the treatment and/or prevention of sexual dysfunctions in patients, including males and females, by administering the  
20 compounds and compositions described herein. The present invention is also directed to enhancing sexual responses in patients, including males and females, by administering the compounds and/or compositions described herein. The novel compounds and novel compositions of the present invention are described in more detail herein.

25 The  $\alpha$ -adrenergic receptor antagonists that are nitrosated or nitrosylated in accordance with the invention and/or are included in the compositions of the invention can be any of those known in the art, including those exemplified below. Structurally, the  $\alpha$ -antagonists can generally be categorized as haloalkylamines, imidazolines, quinoxolines, indole derivatives, phenoxypropanolamines, alcohols,  
30 alkaloids, amines, piperizines, piperidines and amides.

The first group of  $\alpha$ -adrenergic receptor antagonists are the haloalkylamines that irreversibly block  $\alpha_1$ - and  $\alpha_2$ -adrenergic receptors. Included in this group are, for example, phenoxybenzamine and dibenamine. Phenoxybenzamine is used in the

treatment of pheochromocytomas, tumors of the adrenal medulla and sympathetic neurons that secrete catecholamines into the circulation. It controls episodes of severe hypertension and minimizes other adverse effects of catecholamines such as contraction of plasma volume and injury of the myocardium.

5           Another group of  $\alpha$ -adrenergic receptor antagonists are the imidazolines. These include phentolamine and tolazoline. Phentolamine has similar affinity for  $\alpha_1$  and  $\alpha_2$  receptors. Phentolamine is used in short-term control of hypertension in patients with pheochromocytoma and direct, intracavernous injection of phentolamine (usually in combination with papaverine) has been proposed as a  
10           treatment for male sexual dysfunction. Tolazoline is used in the treatment of persistent pulmonary hypertension in neonates. Other imidazolines include, for example, idazoxan, deriglidole, RX 821002, BRL 44408 and BRL-44409 (see, Young et al, *Eur. J. Pharm.*, 168:381-386 (1989), the disclosure of which is incorporated herein by reference).

15           Another group of  $\alpha$ -adrenergic receptor antagonists that are contemplated are the quinazolines. These include, for example, prazosine, a very potent and selective  $\alpha_1$ -adrenergic antagonist, terazosin, doxazosin, alfuzosin, bunazosin, ketanserin, trimazosin and abanoquil. This group of compounds is principally used in the treatment of primary systemic hypertension and also in the treatment of congestive  
20           heart failure.

            Another class of  $\alpha$ -adrenergic receptor antagonists are indoles and indole derivatives. These include, for example, carvedilol and BAM 1303. Another class of  $\alpha$ -adrenergic receptor antagonists are alcohols. These include, for example, labetalol and ifenprodil.

25           Another class of  $\alpha$ -adrenergic receptor antagonists are alkaloids. These include, for example, "ergotoxine" which is a mixture of three alkaloids: ergocornine, ergocristine and ergocryptine. Both natural and dihydrogenated peptide alkaloids produce  $\alpha$ -adrenergic blockade. The principal uses are to stimulate contraction of the uterus post-partum and to relieve the pain of migraine headaches. Another  
30           indole alkaloid is yohimbine. This compound is a competitive antagonist that is selective for  $\alpha_2$ -adrenergic receptors. In humans, it has been observed to increase blood pressure and heart rate and has been used in the treatment of male sexual dysfunction. Other alkaloid  $\alpha$ -adrenergic receptor antagonists include rauwolscine,

corynathine, raubascine, tetrahydroalstonine, apoyohimbine, akuammigine,  $\beta$ -yohimbine, yohimbol, pseudoyohimbine, epi-3 $\alpha$ -yohimbine, 10-hydroxy-yohimbine and 11-hydroxy-yohimbine. The indole alkaloids are typically obtained from plant extracts or tree barks.

5 Another class of  $\alpha$ -adrenergic receptor antagonists are amines. These include, for example, tamsulosin, benoxathian, atipamezole, BE 2254, WB 4101, HU-723, tedisamil, mirtazipine, setiptiline, reboxitine and delequamine.

10 Another class of  $\alpha$ -adrenergic receptor antagonists are piperizines, which include, for example, naftopil, saterinone, SL 89.0591, ARC 239, urapidil, 5-methylurapidil and monatepi. Urapidil is a selective  $\alpha_1$ -adrenergic antagonist that has a hypotensive effect in humans.

Another class of  $\alpha$ -adrenergic receptor antagonists are piperidines. These include, for example, haloperidol.

15 Another class of  $\alpha$ -adrenergic receptor antagonists are amides, such as indoramin and SB 216469. Indoramin is a selective, competitive  $\alpha_1$ -antagonist that has been used for the treatment of hypertension.

20 Other  $\alpha$ -adrenergic receptor antagonists include moxislyte, trazodone, dapiprozole, efaroan, Recordati 15/2739, SNAP 1069, SNAP 5089, SNAP 5272, RS 17053, SL 89.0591, KMD 3213, spiperone, AH 11110A, chloroethylclonidine, BMY 7378 and niguldipine.

## Scheme XXIV

The compounds of the present invention include  $\alpha$ -adrenergic receptor antagonists, including those described herein, which have been nitrosated and/or nitrosylated through one or more sites such as oxygen (hydroxyl condensation), sulfur (sulfhydryl condensation), carbon and/or nitrogen. The nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists of the present invention donate, transfer or release a biologically active form of nitrogen monoxide (nitric oxide).

Nitrogen monoxide can exist in three forms: NO<sup>-</sup> (nitroxyl), NO<sup>•</sup> (nitric oxide) and NO<sup>+</sup> (nitrosonium). NO<sup>•</sup> is a highly reactive short-lived species that is potentially toxic to cells. This is critical because the pharmacological efficacy of NO depends upon the form in which it is delivered. In contrast to the nitric oxide radical (NO<sup>•</sup>), nitrosonium (NO<sup>+</sup>) does not react with O<sub>2</sub> or O<sub>2</sub><sup>-</sup> species, and functionalities capable of transferring and/or releasing NO<sup>+</sup> and NO<sup>-</sup> are also resistant to decomposition in the presence of many redox metals. Consequently, administration of charged NO equivalents (positive and/or negative) does not result in the generation of toxic by-products or the elimination of the active NO moiety.

Compounds contemplated for use in the present invention (e.g.,  $\alpha$ -adrenergic receptor antagonists and/or nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists) are, optionally, used in combination with nitric oxide and compounds that release nitric oxide or otherwise directly or indirectly deliver or transfer nitric oxide to a site of its activity, such as on a cell membrane *in vivo*.

The term "nitric oxide" encompasses uncharged nitric oxide (NO<sup>•</sup>) and charged nitrogen monoxide species, preferably charged nitrogen monoxide species,

such as nitrosonium ion ( $\text{NO}^+$ ) and nitroxyl ion ( $\text{NO}^-$ ). The reactive form of nitric oxide can be provided by gaseous nitric oxide. The nitric oxide releasing, delivering or transferring compounds, have the structure  $\text{F-NO}$ , wherein F is a nitric oxide releasing, delivering or transferring moiety, include any and all such compounds which provide nitric oxide to its intended site of action in a form active for its intended purpose. The term "NO adducts" encompasses any nitric oxide releasing, delivering or transferring compounds, including, for example, S-nitrosothiols, organic nitrites, organic nitrates, S-nitrothiols, sydnonimines, 2-hydroxy-2-nitrosohydrazines (NONOates), (E)-alkyl-2-[(E)-hydroxyimino]-5-nitro-3-hexene amines or amides, nitrosoamines, furoxanes as well as substrates for the endogenous enzymes which synthesize nitric oxide. The "NO adducts" can be mono-nitrosylated, poly-nitrosylated, mono-nitrosated and/or poly-nitrosated at a variety of naturally susceptible or artificially provided binding sites for nitric oxide.

One group of NO adducts is the S-nitrosothiols, which are compounds that include at least one -S-NO group. These compounds include S-nitroso-polypeptides (the term "polypeptide" includes proteins and polyamino acids that do not possess an ascertained biological function, and derivatives thereof); S-nitrosylated amino acids (including natural and synthetic amino acids and their stereoisomers and racemic mixtures and derivatives thereof); S-nitrosylated sugars; S-nitrosylated, modified and unmodified, oligonucleotides (preferably of at least 5, and more preferably 5-200 nucleotides); straight or branched, saturated or unsaturated, aliphatic or aromatic, substituted or unsubstituted S-nitrosylated hydrocarbons; and S-nitroso heterocyclic compounds. S-nitrosothiols and methods for preparing them are described in U.S. Patent Nos. 5,380,758 and 5,703,073; WO 97/27749; WO 98/19672; and Oae et al, *Org. Prep. Proc. Int.*, 15(3):165-198 (1983), the disclosures of each of which are incorporated by reference herein in their entirety.

Another embodiment of the present invention is S-nitroso amino acids where the nitroso group is linked to a sulfur group of a sulfur-containing amino acid or derivative thereof. Such compounds include, for example, S-nitroso-N-acetylcysteine, S-nitroso-captopril, S-nitroso-N-acetylpenicillamine, S-nitroso-homocysteine, S-nitroso-cysteine and S-nitroso-glutathione.

Suitable S-nitrosylated proteins include thiol-containing proteins (where the NO group is attached to one or more sulfur groups on an amino acid or amino acid

derivative thereof) from various functional classes including enzymes, such as tissue-type plasminogen activator (TPA) and cathepsin B; transport proteins, such as lipoproteins; heme proteins, such as hemoglobin and serum albumin; and biologically protective proteins, such as immunoglobulins and cytokines. Such nitrosylated proteins are described in WO 93/09806, the disclosure of which is incorporated by reference herein in its entirety. Examples include polynitrosylated albumin where one or more thiol or other nucleophilic centers in the protein are modified.

Other examples of suitable S-nitrosothiols include:

Nitrosothiols can be prepared by various methods of synthesis. In general, the thiol precursor is prepared first, then converted to the S-nitrosothiol derivative by nitrosation of the thiol group with  $\text{NaNO}_2$  under acidic conditions (pH is about 2.5) which yields the S-nitroso derivative. Acids which can be used for this purpose include aqueous sulfuric, acetic and hydrochloric acids. The thiol precursor can also be nitrosylated by reaction with an organic nitrite such as tert-butyl nitrite, or a nitrosonium salt such as nitrosonium tetrafluoroborate in an inert solvent.

The compounds that include at least one ON-O-, ON-N- or ON-C- group are preferably ON-O-, ON-N- or ON-C-polypeptides (the term "polypeptide" includes proteins and polyamino acids that do not possess an ascertained biological function, and derivatives thereof); ON-O-, ON-N- or ON-C-amino acids (including natural and synthetic amino acids and their stereoisomers and racemic mixtures); ON-O-, ON-N- or ON-C-sugars; ON-O-, ON-N- or ON-C- modified or unmodified oligonucleotides (comprising at least 5 nucleotides, preferably 5-200 nucleotides); ON-O-, ON-N- or ON-C- straight or branched, saturated or unsaturated, aliphatic or aromatic, substituted or unsubstituted hydrocarbons; and ON-O-, ON-N- or ON-C-heterocyclic compounds.

Preferred examples of compounds comprising at least one O<sub>2</sub>N-O-, O<sub>2</sub>N-N-, O<sub>2</sub>N-S- or O<sub>2</sub>N-C- group include isosorbide dinitrate, isosorbide mononitrate, clonitrate, erythrityltetranitrate, mannitol hexanitrate, nitroglycerin, pentaerythritoltetranitrate, pentrinitrol and propatyl nitrate.

Another group of NO adducts are N-oxo-N-nitrosoamines that donate, transfer or release nitric oxide and are represented by the formula: R<sup>1</sup>R<sup>2</sup>-N(O-M<sup>+</sup>)-NO, where R<sup>1</sup> and R<sup>2</sup> are each independently a polypeptide, an amino acid, a sugar, a modified or unmodified oligonucleotide, a straight or branched, saturated or unsaturated, aliphatic or aromatic, substituted or unsubstituted hydrocarbon, or a heterocyclic group, and where M<sup>+</sup> is an organic or inorganic cation, such as, for example, an alkyl substituted ammonium cation or a Group I metal cation.

Another group of NO adducts are thionitrates that donate, transfer or release nitric oxide and are represented by the formula: R<sup>1</sup>-(S)-NO<sub>2</sub>, where R<sup>1</sup> is a polypeptide, an amino acid, a sugar, a modified or unmodified oligonucleotide, a straight or branched, saturated or unsaturated, aliphatic or aromatic, substituted or unsubstituted hydrocarbon, or a heterocyclic group. Preferred are those compounds where R<sup>1</sup> is a polypeptide or hydrocarbon with a pair or pairs of thiols that are sufficiently structurally proximate, i.e., vicinal, that the pair of thiols will be reduced to a disulfide. Compounds which form disulfide species release nitroxyl ion (NO-) and uncharged nitric oxide (NO•). Compounds where the thiol groups are not sufficiently close to form disulfide bridges generally provide nitric oxide as the NO-form and not as the uncharged NO• form.

The present invention is also directed to agents that stimulate endogenous NO or elevate levels of endogenous endothelium-derived relaxing factor (EDRF) *in vivo* or are substrates for nitric oxide synthase.           "Therapeutically effective amount" refers to the amount of the  $\alpha$ -adrenergic receptor antagonist, nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonist, nitric oxide donor and/or vasoactive agent that is effective to achieve its  
30           intended purpose. While individual patient needs may vary, determination of optimal ranges for effective amounts of each of the compounds and compositions is within the skill of the art. Generally, the dosage required to provide an effective amount of the composition, and which can be adjusted by one of ordinary skill in the

art will vary, depending on the age, health, physical condition, sex, weight, extent of the dysfunction of the recipient, frequency of treatment and the nature and scope of the dysfunction or disease.

5 The amount of a given  $\alpha$ -adrenergic receptor antagonist (including nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists) or vasoactive agent which will be effective in the prevention or treatment of a particular dysfunction or disease will depend on the nature of the dysfunction or disease, and can be determined by standard clinical techniques, including reference to Goodman and Gilman, supra; The Physician's Desk Reference, supra; Medical Economics Company, Inc., Oradell,  
10 N.J., 1995; and Drug Facts and Comparisons, Inc., St. Louis, MO, 1993. The precise dose to be used in the formulation will also depend on the route of administration, and the seriousness of the dysfunction or disorder, and should be decided by the physician and the patient's circumstances.

15 The usual doses of  $\alpha$ -adrenergic receptor antagonists (including nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists) are about 1 mg to about 100 mg per day, preferably about 0.5 mg to about 10 mg per day. The oral dose of  $\alpha$ -adrenergic receptor antagonists (including nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists) are about 1 mg to about 100 mg per day preferably about 5 mg to about 80 mg per day.

20 The doses of nitric oxide donors in the pharmaceutical composition can be in amounts of about 0.001 mg to about 20 g, although the actual amount administered will be dependent on the specific nitric oxide donor. For example, when L-arginine is the nitric oxide donor, the dose is about 2 g/day to about 6 g/day, preferably about 3 g/day, administered orally at least one hour prior to sexual activity or  
25 sexual intercourse. Effective doses can be extrapolated from dose-response curves derived from *in vitro* or animal model test systems and are in the same ranges or less than as described for the commercially available compounds in the Physician's Desk Reference, supra.

30 The nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonists of the invention are used at dose ranges and over a course of dose regimen and are administered in the same or substantially equivalent vehicles/carrier by the same or substantially equivalent as their non-nitrosated/nitrosylated counterparts. The nitrosated and/or nitrosylated compounds of the invention can also be used in

lower doses and in less extensive regimens of treatment. The amount of active ingredient that can be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration.

5           The dosage regimen for treating a condition with the compounds and/or compositions of this invention is selected in accordance with a variety of factors, including the type, age, weight, sex, diet and medical condition of the patient, the severity of the dysfunction, the route of administration, pharmacological considerations such as the activity, efficacy, pharmacokinetic and toxicology profiles  
10 of the particular compound used, whether a drug delivery system is used, and whether the compound is administered as part of a drug combination. Thus, the dosage regimen actually used can vary widely and therefore may deviate from the preferred dosage regimen set forth herein.

          Particularly preferred methods of administration of the contemplated  
15  $\alpha$ -adrenergic receptor antagonist compositions (including nitrosated and/or nitrosylated  $\alpha$ -adrenergic receptor antagonist compositions) for the treatment of male sexual dysfunction are by oral administration, by transdermal application, by injection into the corpus cavernosum, by transurethral administration or by the use of suppositories. The preferred methods of administration for female sexual  
20 dysfunction are by oral administration, topical application, transdermal application or by the use of suppositories.

          The present invention also provides pharmaceutical kits comprising one or more containers filled with one or more of the ingredients of the pharmaceutical compounds and/or compositions of the present invention, including, one or more  
25  $\alpha$ -adrenergic receptor antagonists, optionally substituted with one or more NO and/or NO<sub>2</sub> groups, one or more of the NO donors, and one or more vasoactive agents. Such kits can also include, for example, other compounds and/or compositions (e.g., permeation enhancers, lubricants, and the like), a device(s) for administering the compounds and/or compositions, and written instructions in a  
30 form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceuticals or biological products, which instructions can also reflect approval by the agency of manufacture, use or sale for human administration.

#### **Example 19: *In Vivo* Comparative Erectile Responses - I**

Male New Zealand white rabbits weighing 2.5 kg were used as the animal model. Animals were first relaxed with an i.m. injection of 25 mg/kg ketamine prior to anesthesia with a bolus i.v. injection of 10 mg/kg Profol and maintained with i.v. infusion at 0.5 mg/kg/minutes. Ventilation of the animals was performed with 1% halothane plus 0.8 L/min O<sub>2</sub> and 1 L/min N<sub>2</sub>O. A 22 gauge angiocatheter was placed in the femoral artery for measurement of systemic blood pressure. A dorsal incision was made in the penis and the corpora cavernosum exposed and cannulated with a 21 gauge butterfly needle to measure intracavernosal pressure.

Drugs at various concentrations were delivered intracavernosally at a volume of 150 µl through a 25 gauge needle. A 150 µl solution of a mixture of papaverine (30 mg/kg), phentolamine (1 mg/kg) and prostaglandin E<sub>1</sub> (10 µg/ml) (pap/phent/PGE<sub>1</sub>) was injected in the corpora as a standard solution for comparison with the response of yohimbine, Example 1, Example 2, and the combination of yohimbine and Example 1. This pap/phent/PGE<sub>1</sub> mixture is considered to cause a maximal erection-inducing effect.

As shown in Fig. 1, yohimbine dose dependently induced erectile response in the anesthetized rabbit. A 500 µg dose of Example 1 was able to induce near maximal response relative to the standard dose of pap/phent/PGE<sub>1</sub>. A combination of the submaximal dose of yohimbine (150 µg) and Example 1 (500 µg) also induced maximum erectile response. Yohimbine at both the submaximal and maximal efficacy doses produced very short duration of action (Fig. 2). Example 1 produced a much longer duration of action. The duration of action is potentiated by a combination of Example 1 and yohimbine which is longer than the sum of the duration of each of these compounds alone (Fig. 2).

Fig. 3 shows that the compound of Example 2 at the 500 µg dose is equipotent to the standard dose of pap/phent/PGE1. A higher dose of the compound of Example 2 (1 mg) is at least equal to or more efficacious than the standard dose of the pap/phent/PGE1 mixture.

5 Fig. 4 shows that the compound of Example 2 has the advantage of producing longer duration of action compared to yohimbine. Fig. 5A demonstrates that a dose (500 µg) of the compound of Example 2 effective in the erectile response did not produce any effect on systemic blood pressure upon intracavernosal injection. However, Fig. 5B demonstrates that a standard dose of the mixture of  
10 pap/phent/PGE1 produced a significant decrease in systemic blood pressure upon intracavernosal injection, suggesting that the compound of Example 2 lacks this side effect.

Fig. 6 shows that intracavernosal administration of 1 mg of Example 6 is more efficacious than 1 mg moxisylyte in inducing the erectile response *in vivo* in the  
15 anesthetized rabbit. Fig. 7 shows that a 1 mg dose of Example 6 produces a longer duration of erectile response compared to 1 mg moxisylyte. Also, Fig. 7 shows that 2 mg of Example 6 produces a much longer duration of action compared to 2 mg moxisylyte.

#### Example 20 *In vivo* Comparative Erectile Responses - II

20 White New Zealand male rabbits (2.6 -3.0 kg) were anesthetized with pentobarbital sodium (30 mg/kg). The femoral artery was exposed and indwelled with PE 50 tubing connected to a transducer for recording systemic arterial blood pressure. The ventral aspect of the penis was then exposed via surgical cut and intracavernosal blood pressure was measured using a 23 gauge needle inserted to  
25 the corpus cavernosum. The contralateral corpus cavernosum was implanted with a 23 gauge needle for the administration of drugs.

Following all surgical procedures, rabbits were allowed to rest for 10 minutes during which intracavernosal blood pressure (ICP) and mean arterial blood pressure (MABP) were continuously recorded.

30 Drugs at various concentrations were prepared as aqueous solution (injection volume of 200 µL). Following drug injection the tubing was flushed with 100 µL distilled water. All drug treatments were administered after stable intracavernosal and systemic blood pressures were established. If an increase in intracavernosal

blood pressure (ICP) was observed, the effect was monitored throughout its entire duration. Animals that did not exhibit an increase in ICP received an injection of a combination of phentolamine (0.2 mg) and papaverine (6.0 mg) to confirm the accuracy of needle implantation and to evaluate the erectile responsiveness of the animal. Animals that did not respond to this combination were disregarded from the analysis.

The following parameters were obtained from each experimental recording: (i) Maximum ICP (mm Hg), (ii) Duration (minutes), defined as the time in minutes, that the increase in ICP is greater than the 50% difference between baseline and maximum response. Data were analyzed using ANOVA statistical analysis ( $p < 0.05$ ).

Fig. 8 shows the peak erectile response *in vivo* in the anesthetized rabbit following the intracavernosal administration of various doses of Example 9 (0.2 mg, 0.4 mg, 0.8 mg and 1.6 mg).

Fig. 9 shows the duration of the erectile response *in vivo* in the anesthetized rabbit upon intracavernosal administration of various doses of Example 9 (0.2 mg, 0.4 mg, 0.8 mg and 1.6 mg).

Fig. 10 shows the peak erectile response *in vivo* in the anesthetized rabbit following the intracavernosal administration of various doses of Example 10 (0.64 mg, 1.07 mg, 2.13 mg and 4.26 mg).

Fig. 11 shows the duration of the erectile response *in vivo* in the anesthetized rabbit upon intracavernosal administration of various doses of Example 10 (0.64 mg, 1.07 mg, 2.13 mg and 4.26 mg).

Fig. 10 and Fig. 11 show that 1.07 mg of Example 10 produces a moderate and short-lasting increase of ICP. At 2.13 mg and 4.26 mg of Example 10 a robust effect on both the magnitude and duration of increase in intracavernosal pressure was observed. At 4.26 mg, the duration of the erectile response exceeded 120 minutes. Fig. 8 to Fig. 11 show that the doses of Example 9 needed to produce a robust increase of ICP is lower than the doses of Example 10. At the doses of Example 9, the duration of the erectile was somewhat shorter than that of Example 10.
